

magic_ball_anchored_accuracy

MAGIC -- ball $||\beta||^2 \leq 2$ (radius $\sqrt{2}$). $d = 9$ coefficients, no intercept. Step size $h = 0.0001$ (actually used). Mini-batch $m = 30$. $R = 100$ independent sampler replicates on one fixed stratified 80/20 split ($n_{\text{train}} = 15216$, $n_{\text{test}} = 3804$). Anchor parameter $\rho = \log 2 = 0.693147$ for the anchored methods ($\rho = 0$ otherwise). Block strengths $s = (0.1, 0.1, 0.1)$. Shaded bands: mean ± 1 SD (ddof = 1) across replicates -- repeat-run variability conditional on the fixed dataset and split, not a confidence or credible interval. Block strengths selected by a training-only sweep over 14 candidates (criterion: mean TRAINING accuracy over the last 25% of checkpoints); test labels were not used to choose s .
