

magic_ball_anchored_tuned

MAGIC -- ball $\|\beta\|^2 \leq 2$ (radius $\sqrt{2}$). $d = 9$ coefficients, no intercept. Step size $h = 1e-05$ (actually used). Mini-batch $m = 30$. $R = 100$ independent sampler replicates on one fixed stratified 80/20 split ($n_{\text{train}} = 15216$, $n_{\text{test}} = 3804$). Anchor parameter $\rho = \log 2 = 0.693147$ for the anchored methods ($\rho = 0$ otherwise). Block strengths $s = (0.5, 0.5, 0.5)$. Shaded bands: mean ± 1 SD (ddof = 1) across replicates -- repeat-run variability conditional on the fixed dataset and split, not a confidence or credible interval. Step size h and block strengths s selected by a TRAINING-ONLY sweep over 5 step sizes $\times$ 14 strength triples (criterion: mean training accuracy over the last 25% of checkpoints). Test labels were not used to select anything.
