

# Non-reversible anchored Langevin — unit ball, $d = 9$ (supplementary: auto-scaled axis)

Training accuracy (n = 1600)

Test accuracy (n = 400)

$d = 9$ ; constraint: unit ball; step size  $h = 0.0001$ ; mini-batch  $m = 50$ ; repeats  $R = 100$ ; iterations = 1000; anchor  $\rho = \log 2 (0.6931)$  for anchored methods, 0 otherwise; block strengths  $s = (10.0, 10.0, 10.0)$ . Lines are the across-replicate mean; bands are mean  $\pm 1$  sample sd (ddof = 1) of single-iterate accuracy, i.e. repeat-run variability -- NOT confidence or posterior credible intervals.
