

Non-reversible anchored Langevin — quartic set, d = 9

d = 9; constraint: quartic set; step size $h = 0.0001$; mini-batch $m = 50$; repeats $R = 100$; iterations = 1000; anchor $\rho = \log 2 (0.6931)$ for anchored methods, 0 otherwise; block strengths $s = (10.0, 10.0, 10.0)$. Lines are the across-replicate mean; bands are mean ± 1 sample sd (ddof = 1) of single-iterate accuracy, i.e. repeat-run variability -- NOT confidence or posterior credible intervals.
