

$\lambda_{\text{lasso}} = 0$ (anchor vacuous, $a = 1$) — L1-smooth ball

Training accuracy (n = 1600)

Test accuracy (n = 400)

$d = 9$ (intercept + 8 slopes); constraint: L1-smooth ball, threshold 3.7; $\lambda_{\text{lasso}} = 0$ so $U = f$ is SMOOTH and $a(w) = 1$ identically -- the update is plain projected Langevin;

EXACT gradient; $\eta = 0.0001$; $R = 100$; iterations = 1000; block strengths $s = (3.0, 3.0, 3.0)$; $\alpha = 0$ vs 1.

Lines are the across-replicate mean; bands are mean $\pm$ 1 sample sd (ddof = 1) of single-iterate accuracy -- repeat-run variability, NOT confidence or credible intervals. Axis windowed on the plateau, not $[0, 1]$.
