

Exact-gradient anchored Langevin — L1-smooth ball

Training accuracy (n = 1600)

Test accuracy (n = 400)

$d = 9$ (intercept + 8 slopes); constraint: L1-smooth ball, threshold 3.7; $U = f + g$ with $g = 10.0 \cdot \sum |w_j|$ (non-differentiable), anchor delta = 0.02;

EXACT gradient of U_0 (no mini-batch); eta = 0.0001; $R = 100$; iterations = 1000; block strengths $s = (3.0, 3.0, 3.0)$; alpha = 0 vs 1.

Lines are the across-replicate mean; bands are mean $\pm$ 1 sample sd (ddof = 1) of single-iterate accuracy, i.e. repeat-run variability -- NOT confidence or credible intervals. Axis windowed on the plateau, not [0, 1].
