

titanic_lp: block-strength sweep at the specified $\eta = 3 \times 10^{-5}$

Paired final-iterate difference, non-reversible minus reversible, in percentage points, over $R = 150$ coupled replicates sharing one W_0 and one Gaussian stream. $\eta = 3\text{e-}5$ was SPECIFIED, not selected; s was swept, so all five strengths are shown. The $s = 0$ point is the control -- with $J = 0$ the update is the reversible update, so the difference is exactly 0.000 and the error bar has zero width. Bars are ± 2 paired standard errors; with four live strengths per panel, $|t| > 2.5$ is the honest bar. Seed 4100 throughout.
