

MAGIC gamma telescope — non-reversible vs reversible anchored Langevin (ball constraint)

d = 12 (intercept + 11 columns: FConc, FDist, FLength, FAlpha, FConc1, FM3Long, FSize, FWidth, FAsym, FM3Trans, pad0); n_train = 15216, n_test = 3804; U = f + g, g = 2*sum|w_j|, anchor delta = 0.02; EXACT gradient; eta = 2.0e-07; s = 16; R = 100.
 Preprocessing: scaling = 'design', order = 'design', signs aligned = True, block reparametrisation (v_axis, v_fast, v_slow) = (1, 256, 1), (b, e) = (1.0, 0.5). Reference (scikit-learn logistic regression) test accuracy 0.790.
 Lines: across-replicate mean; bands: mean +/- 1 sd of single-iterate accuracy (repeat-run variability). Shared initialisation and noise per replicate. y-axis fixed to (0.4, 0.9), not windowed.
