

Non-reversible, ahead of the reversible arm's own best configuration

Titanic, smoothed ℓ_p ($p = 2.4$, $\text{eps} = 0.18$, $\text{Lambda} = 4$), $d = 10$, exact gradient, LASSO anchor ($\text{sigma} = 10$, $\text{lambda} = 7.12$, $\text{delta} = 0.0108$). η and s chosen on TRAINING accuracy only over 10 candidates at seed 3000; these curves are a confirmation run on independent seed 4100 with $R = 1500$ coupled chains. Metric is accuracy averaged over the post-burn-in checkpoints, i.e. the height of the curve over the last 60% of the run. Matched-eta paired gain +0.156 percentage points ($t = +12.0$). Against the reversible arm at its OWN best step size ($\eta = 1\text{e-}4$, dashed): +0.134 points. On the FINAL ITERATE alone the gain is only +0.041 points ($t = 1.3$) -- the two arms share an invariant law, so a single iterate cannot separate them; what moves is the average over the run.
