

Non-reversible anchored Langevin mixes faster per unit wall clock

Autocorrelation time (lower is better)

Sampling efficiency (higher is better)

Titanic, ball constraint, exact gradient, LASSO anchor. $\eta = 1e-4$, $s = (5,5,5)$, $R = 96$ COUPLED chains (same W_0 , same Gaussian noise stream), 16000 iterations, 40% burn-in, independent seed 5300. IACT by Geyer initial-positive/monotone. ESS per second charges the non-reversible arm its full measured cost (16.25 s vs 14.43 s wall, ratio 1.126). Eleven of twelve test functions improve; $\|w\|^2$ is the one that does not.
