

# The worst-case test function, measured eight ways

Speed-up for w7, the slowest-mixing coordinate and the pre-registered primary test function. Green squares: Geyer-estimator measurements at four seeds and two burn-in fractions, including one stationary-start run. The black diamond is a truncation-free estimator (ESS from the across-chain variance of chain time-averages), which is immune to Geyer truncation and carries a bootstrap 95% interval that includes 1. Pooling the six Geyer values gives about x1.2, not the x1.31 of the single best run: the headline number sits at the optimistic end of its own sampling distribution.
