

Specified design $X \sim N(0, 2I)$ - posterior condition number 1.63

Reversible vs non-reversible ANCHORED Langevin only ($\rho = \log 2$ in both; $\alpha = 0$ vs 1). Paired per-replicate differences, $R = 100$, $h = 1e-4$, $m = 50$, 1000 iterations. Accuracy has no headroom on this design: the Bayes ceiling is ~ 0.671 and both methods reach ~ 0.654 . The variance of ergodic averages is what non-reversibility actually targets.
