

Non-reversible beats reversible anchored Langevin — unit ball

d = 9 (intercept + 8 slopes); constraint: unit ball; $U = f + g$ with $g = 2 \cdot \sum |w_j|$ (non-differentiable), anchor delta = 0.02; EXACT gradient;
 design: block-anisotropic, Σ_X eigenvalues (10, 1, 0.1) inside each coordinate triple, matching the block structure of J ; $\eta = 7.87e-06$; $R = 100$; $s = (5.0, 5.0, 5.0)$; $\alpha = 0$ vs 1.
 Lines are the across-replicate mean; bands are mean ± 1 sample sd (ddof = 1) of single-iterate accuracy -- repeat-run variability, NOT confidence or credible intervals. Axis windowed on the plateau, not [0, 1].
