

magic_ball: anchored Langevin, $s = (1, 1, 1)$

MAGIC -- ball $\|\beta\|^2 \leq 2$ (radius $\sqrt{2}$). $d = 9$, no intercept. Block strengths $s = (1, 1, 1)$. Step size $h = 3e-07$ (actually used). Mini-batch $m = 30$. $R = 200$ independent replicates on one fixed stratified 80/20 split ($n_{\text{train}} = 15216$, $n_{\text{test}} = 3804$). Anchor $\rho = \log 2 = 0.693147$ for both arms. Bands: mean $\pm$ 1 SD (ddof = 1) across replicates -- repeat-run variability at a fixed split, not a confidence or credible interval. h selected per experiment by the paired TRAINING gain over 4 candidates; these curves are a CONFIRMATION run on independent replicates (seed 4100) not used for that selection. Verdict on the paired training difference: non-reversible WINS.
